### Description:

A Keyword Find search for "Harry Potter" on our Test server gives only 1 result.

A \*Browse\* for title "Harry Potter" shows almost 100.

### Resolution:

Looking at the Oct 18, 2010, \$alephe\_scratch/abc01\_p\_manage\_01.00281 keyword indexing log, I see this:

```
setenv p_delete_flag "1"  
setenv p_start_doc_number_x "002524386"  
setenv p_end_doc_number_x "002524387"
```

The submission screen \*used\* to allow the submitter to select either Update or Delete, but there were problems with the Update (primarily, the generation of duplicate index entries), so that was eliminated. Now the p\_delete\_flag is forced to "1".

The p\_manage\_01 Help says this: "Note that in most cases this should be set to update documents for the entire range of the database, from 000000000 to 999999999. If you set a narrower range, the word index will be incomplete. Note that the option to update a narrower range should only be used for conversion purposes."

The solution is to run p\_manage\_01 for abc01 with:

```
From Document Number 000000000  
To Document Number 999999999
```

Note: If you want to reindex a relatively small range of documents, you can use the p\_manage\_40 service to generate z07 indexing requests, which will be processed by the ue\_01 indexing daemon -- including Word indexing.
