
Aleph 20 database - Audit trail

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Description:

The default V.20 Aleph database comes with the setting:

```
audit_trail = 'db'
```

This creates quite a few Audit files out there. Is there a need for me to have auditing on within the database or can I turn it off until if/when we might have a problem which needs to be addressed by auditing the database?

Resolution:

Yes, you may turn the audit_trail parameter off.
