
WebV: Skin Files contain incorrect version info

- **Article Type:** General
 - **Product:** Voyager
 - **Product Version:** 8.2.0
-

Description:

Bug Report for Issue 16384-10177

Module(s): WebVoy?ge

Server platform(s) affected: All

PC OS (if applicable): All

Browser & version (if applicable): All

Release(s) replicated in: 7.2.1

Last version without bug (if applicable): N/A

Expected results:

WebVoy?ge configuration files that contain a version number will show the last version in which that file was modified

Actual results:

With the 7.2.1 release, several WebVoy?ge configuration files were modified, but their version numbers still read “7.2.0” or earlier

Workflow implications: Customers will think that their skin files are out of date, when in fact they are current.

Replication steps:

- 1.SSH onto the Voyager Web Server
- 2.Change directories to /m1/voyager/xxxdb/tomcat/vwebv/context/vwebv/ui/exl_default
- 3.Check the version of any file (e.g. css/changePin.css) by typing “cat css/changePin.css | grep Version”
- 4.The result of step three will say 7.2.0, when it should say 7.2.1

Resolution:

New line was added to the top of each of the skin files in 8.2.0 to indicate the revision number and date.
