

Cannot right-click in search boxes

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Description:

The new Windows control for search text fields in the GUI Search tab of V.20.2 doesn't support the standard right-click pop-up edit menu. V.20.1 Aleph does support this feature.

Resolution:

This is related to an enhancement associated with combined character support, and there is a parameter in the GUI that will implement the original Windows control with the right-click menu option if you prefer. The parameter is in alephcom.ini, named CombinedCharSupported. Here is how this parameter behaves:

1) When CombinedCharSupported=Y in alephcom.ini (combined characters supported), in the search edit fields you have:

- support for combined characters
- standard Microsoft right-click menu
- no multiple fonts

2) When CombinedCharSupported=N in alephcom.ini (combined characters supported), in the search edit fields you have:

- no combined characters
- no right-click menu
- multiple fonts.

In this case ('N' option) the 'classic' Aleph search fields are used. (edit search fields in all versions before 20.1). No right-click menu support.

For the standard MS right-click menu feature in search text field, change the CombinedCharSupported parameter to 'Y'.
