
15.2 apache installation documentation

- **Article Type:** General
- **Product:** Aleph
- **Product Version:** 15.2

Description:

The "How to Install and Configure the Apache Server and SSL (Optional) ALEPH 15 and MetaLib 2.0" is still the december,2002 version;

Using this manual we had a lot of problems with the installation of apache server for 15.2 in the past. Next week we'll install the 15.02.04 on our Linux server and we absolutely need the updated version of this document.

Can you please send it to us?

Resolution:

In 15.2, all the third party products (including Apache) are installed automatically at ALEPH installation time using scripts that were specifically designed to make it easier for the installers.

In other words, Apache does not need to be installed separately and the document should now only be used by those who have specifically chosen to install Apache separately.

Note that the December 2002 Apache documentation for 15.2 is correct and updated.

Additional Information

Apache installation, Linux,
