
Install customer data-Install Oracle data

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Description:

I am following the Guidelines for Aleph 18 to 20 Upgrade to do our upgrade, on page 36 step I, I run unpack the utree and import the Oracle data separately. I received the following info always, no matter it is run for utree or Oracle data. Should I receive an email for oracle data? Or How could we verify that this step has been run correctly and completely.

install customer data status : successful

Please review log file /exlibris/aleph/upgrade_express_1901_2001/logs/log/install_utree.log

Resolution:

The "install customer data status : successful" message is not a reliable indicator of success.

The /exlibris/aleph/upgrade_express_1901_2001/logs/log.20120430.152358/install_utree.log shows the following:

Step begin install_utree

_____ abc01 _____

_____ abc02 _____

_____ abc10 _____

_____ abc11 _____

_____ abc30 _____

_____ abc50 _____

_____ abc60 _____

_____ alephe _____

Step end install_utree

This is not what you should see.

The ./abc01/scratch/count_rep.lst (produced by util a/17/11/1) shows that there is no data in abc01.

It seems that the u-tree (the ABCnn aleph tables) was loaded, but not the Oracle tables. I think you will need to re-run the export step (-- at least for the Oracle data).

I will send my document "Upgrading to Aleph Version 20 - Upgrade Express.ACTUAL RUN.doc" attached to a separate email.
