

## UTIL-X-8: hot or cold?

- **Article Type:** General

### Description:

There was a problem with our clear\_vir01 run this morning and now we are seeing odd things happen in our OPAC.

I want to clear the vir01 library using UTIL-X-8.

When I select that option it asks if I want to use hot or cold.

Which of these should I use?

I'm guessing since we are currently online, hot would probably be the best option but I don't know what the differences are.

### Resolution:

If UTIL-X-8 is being run with the system up, it should be run with "hot".

But if the previous clear\_vir01 has failed, this may not work properly....

The four vir01 tables involved in OPAC are the z63, z05, z110, and the z52. Checking with SQL and with UTIL-A-14-17, I found that the first three were OK, but that the z52 was empty.

Running p\_file\_04 for the vir01 z52 corrected the problem.
