Question

What is the manage-35 ("Update Brief Records") job? How is it run from the command line?

Answer

The manage-35 job builds the z0101 (Brief records) table. The z0101 is important in large catalogs with many titles for prolific authors/composers (such as Shakespeare and Mozart), which need to be sub-arranged.

The manage-35 job is included in the GUI Services --"Build Indexes to the Catalog" menu.

The parameters are: the Procedure to Run, the from_key, to_key range, and the number of processes. The Help describes each..

The internal parameters can be seen in the /alephe/pc_b_eng/p-manage-35.xml file. The command-line command would be `csh -f $aleph_proc/p_manage_35 XXX01,1,000000000,999999999,9 > & xxx01_p_manage_35.log` . The "1" indicating "rebuild entire" and the "9" indicating 9 processes..
