Question

When one starts a WWW Server or PC Server in util w/3, one is asked how many child processes are to be created, but how is the number of child processes which are started when a server is started by aleph_startup specified?

Answer

For the WWW Server the number of child processes is controlled by aleph_start:

```
setenv N_OF_SERVERS 5
```

For the PC Server, by pc_server_defaults:

```
setenv PC_NUM_SERVERS 5
```

Additional Information

See "Increasing number of WWW server handlers" for determination of proper N_OF_SERVERS value" (KB 16384-13282).
