Question

What are the TAG and SUBFIELD parameters in match_doc_gen?
For example:

```
ISSN match_doc_gen TYPE=IND,TAG=022,SUBFIELD=a,CODE=ISSN
```

Answer

The TAG and SUBFIELD parameters refer to the input record only.
The index name is the index the program will match on.
In order to match on a specific subfield in a database field, create index with only this subfield.
