

GDC: Create Record Set Using Match Job

- **Product:** Voyager
 - **Product Version:** 9
-

Question

How to create a record set using GDC Match Job?

Answer

1. Global Data Change (GDC) > Job Management > Submit Match Job
2. Enter job name.
3. Select record type for matching (bibliographic or authority)
4. Browse for or type in path for source file to use for matching.
5. Choose record set to save matching records to - either an existing record set or name for a new record set.
6. Click Run Now. Match Job Progress status window displays until job is complete or cancelled.

7. **Additional Information**

- If a generated 035 from the record file matches more than 1 record in the database, all matching records are added to the record set.
 - See "GDC Execution/Job Management" in the [Global Data Change](#) document for more information.
