
(ASP) Printing or viewing results after running p_ret_01

Description:

We are an ASP site (without ssh access to our server). I just ran p_ret_01 for the first time and the batch log indicated success. However, I am not clear on the next step, where I would like to view, and possibly print, the results.

I thought one of the options was to use one of the print services, but when I tried that using the name of the file I had created in the first process, I got an error message stating that the file does not exist.

Resolution:

While p_ret_01 writes its output to \$alephe_scratch, p_print_03 and the other print jobs read their input from \$data_scratch. The output from p_ret_01 is a list of record numbers.

I have changed the \$aleph_proc/p_ret_01 procedure to also write the output to both \$data_scratch (where it will be available for input to the p_print jobs) and \$data_print (where you can view it).

But this requires that one of the following be used as the outfile name:

p_ret_01_outfile1
p_ret_01_outfile2
p_ret_01_outfile3
p_ret_01_outfile4
p_ret_01_outfile5

As long as you use one of these names, it should work.
