
p_manage_02 Run Modes

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 16.02
-

Description:

In v16, there are 4 options in p-manage-02 "Procedure to Run":

I want to run the manage-02 job from the command line.

How do we know what numbers are assigned to the options above without actually running the job and destroying the index?

Resolution:

"0" is "Update headings index";.

"1" is "Rebuild entire";.

"2" is "Rebuild links between headings and records"; and.

"3" is "Update headings index (when using a multilingual Thesaurus)".

When p_manage_02 follows p_manage_102, it should be run with "0".

If you look at the ./pc_b_eng/p-manage-02.xml, you can see the code for each setting, for instance:.

```
<cbitem>
```

```
<value>0</value>
```

```
<display>Update headings index</display>
```

```
</cbitem>
```

This is true for *all* of the GUI Service jobs..
