Description:

Is there a parameter for the X-Server that will allow me to indicate an xsl stylesheet to use with the xml output?

To clarify, the question is if there is a URL parameter that could be added, for example, to an X-Services "op=present" request where the calling party could specify a stylesheet that they would like to use for the XML that is generated, in order to format the presented data? This might look something like this:

[http://mylib.edu:8995/
X?op=present&set_entry=000000001-000000003&set_number=000936&base=usm01&style=http://web.xxxxx.edu/~library/
x-server/xslt/SimilarityLookup.xsl](http://mylib.edu:8995/X?op=present&set_entry=000000001-000000003&set_number=000936&base=usm01&style=http://web.xxxxx.edu/~library/x-server/xslt/SimilarityLookup.xsl)

Resolution:

Unfortunately, the answer to this question is no. The X-Services.pdf file that explains the X-Services available shows all of the services and parameters that are currently supported.
