
p_file_96 doesn't "read" Z601-BUDGET-NUMBER in the *defs* table

Description:

The Z601-BUDGET-NUMBER field was created with the value from <981 \$\$b 30.00> instead of default value from /abc01/tab/import/cassalini=>

Z601-BUDGET-NUMBER ##### APP-2008

The Z601-BUDGET-NUMBER came from /usm01/tab/import/tab_96_def, BUT it's not specified in the "how to load records with p-file-96" document.

My question: does p-file-96 always take the value from the <981 \$\$b> field and *never* takes default value from tab_96_def/Z601-BUDGET-NUMBER (cassalini - in our case)?

Resolution:

The ./butil/b_file_96_fill_z601 program looks for the 981 subfield b first. If there is none, it checks the bib \$data_tab/import/tab_96_def for a Z601-BUDGET-NUMBER value.

Site made it work with the following \$data_tab/import script:

```
1 LDR ADD-FIELD 981 ,L,$$IAPP-2008
1 981 DELETE-SUBFIELD b
1 981 CHANGE-SUBFIELD I b
```
