## Info: Empty table ../utf\_files ..." message

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 18.01
- 

### Description:

The pc\_server log is full of messages like this:

```
Info: Empty table /tmp/utf_files/exlibris/aleph/u18_2/alephe/error_eng/pc_cat_c0203
```

```
Load: /tmp/utf_files/exlibris/aleph/a18_2/aleph/error_eng/pc_cat_c0203
```

Something appears to be seriously awry.

### Resolution:

The "Info: Empty table /tmp/utf\_files/ ..." message is normal. You can get it in different cases:

1. You will get it with the first access of a file which the system is looking for in utf\_files, after util x/7 has been run. If not found, it will create it with the following message:

```
creating utf version for file:
```

2. error\_eng:

In the case of this specific message, "Info: Empty table /tmp/utf\_files/exlibris/aleph/u18\_2/alephe/error\_eng ...", the system is first looking for the file in the u-tree: /exlibris/aleph/u18\_2/alephe/error\_eng/ directory. Since the ./u18\_2/alephe/error\_eng/ has only your local, customized messages, the \*normal\* thing is for it to find nothing ("Empty table").

It then looks for the file in the a-tree: /tmp/utf\_files/exlibris/aleph/a18\_2/aleph/error\_eng/pc\_cat\_c0203. The a-tree /error\_eng/ directory has the complete set of error\_eng messages as delivered from Ex Libris.
