
How does the Upgrade Express course_adm.conf file get created/populated?

- **Article Type:** General

Description:

Site ran their Production v18-19 Upgrade Express on Saturday 23 May. They were using upgrade_express_1801_1901.tar.1.09.

The 1012 and 1013 steps ran in a couple seconds but did not indicate that any libraries were processed -- and, in fact, did not do anything. On their test server (also with 1801_1901.tar.1.09), these steps ran correctly.

The current_libraries.conf and current_course_libraries.conf on Prod had correct values, but there was no course_adm.conf file. I copied the course_adm.conf file from Test to Prod and then the 1012 and 1013 steps ran correctly.

I'm concerned that other sites could have this same problem.

How is the course_adm.conf file created/populated? Why might this not have happened on Prod?

Resolution:

If you have Course Reading/Reserves, a ./conf/course_adm.conf file showing the ADM library for each Course library must be generated. In order to generate this file, you must enter the course libraries using the "Update upgrade parameters" -- "Update Course Reading Definition" option. If you update the current_course_libraries.conf file directly, it will not be generated.

Therefore, the following note has been added to the 18-19 Upgrade Express document:

"Note that defining/updating the parameters not by the Util might cause problems when running the UE steps. The proper way is to define/update the upgrade parameters using the Utility."
