Description:

How is the z0102 (logical bases) index updated?

Resolution:

Note: Whether the z0102 is built for a particular base is determined by the setting of column 8 in tab_base. The z0102 is not required in order for logical bases to function. It speeds up the building of the Browse display for small bases at large sites.

The p_manage_32 job can be run to rebuild the entire z0102.

In version 17-up, a z07a (z0102 indexing request) record is written whenever a z07 indexing doc record is sent to the server. This z07a record is processed by the ue_01_z0102_index indexing daemon, started at the same time as the regular ue_01.

Additional Information

z0102, logical bases
