## exp\_user\_data succesful but no tar file under /exlibris1/backup/aleph

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 18.01
- 

### Description:

I've been running exp\_user\_data backup for a number a days but I can't fnd the tar file.

The log file is pretty big and i don't see any error messages:

/exlibris/backup/logs

```
"-rwxrwxrwx 1 root root 423312 Mar 16 09:28 ./backup/logs/exp_user_data_a6_Detail_090316_0851.log;"
```

All my cold, hot, user\_data backups go here:

/exlibris1/backup/aleph

But the output of exp\_user\_data isn't there.

### Resolution:

The exp\_user\_data method uses standard ALEPH export procedures, which tar the files and store them in their respective \$data\_files directory. This is so that the procedure that is used to restore from exp\_user\_data export knows where the files are. The restore procedure needs to find them in the \$data\_files directory.
