## Correcting records via loading service

- **Article Type:** Q&A
  - **Product:** Aleph
  - **Product Version:** 18.01
- 

### Question

What is the best way to load corrected records back into the database?

The records were exported (only the tags involved) and corrected outside Aleph. A file in Aleph Sequential format ready to upload to correct the records is available.

What would be the fastest way to process the file? There's no need to re-index the records.

---

### Answer

Run "Load ALEPH Sequential MARC Records (manage-18)" with option "Indexing=None". The service runs very fast and if e.g. started on a weekend there should be no problem.

---

### Additional Information

To be on the save side you could also split the input file into 4 files with 100.000 records each (or even smaller).

**Category:** Cataloging (500)
