## Not-logged-on OPAC user gets wrong base (generic "USM01" base)

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 20
- 

### Description:

We just upgraded to version 18. When we connect to the catalog, we are taken to the default, generic ("USM01") OPAC screen rather than our library-specific screen.

### Resolution:

The default base (and there for the default screen) which a user who is not logged-in connects to in the OPAC is determined by the \$usr\_library z61\_base value for the "ALEPH" z61 record.

{ If the user is not logged-on, the system will look for a z61 "ip profile" matching the ip address; if none, it will use the "ALEPH" profile. }

It seems that the z61\_base is "USM01". It needs to be changed.

To see the current setting, try:

```
select Z61_REC_KEY, Z61_BASE from z61 where Z61_REC_KEY LIKE 'ALEPH%';
```
