
tab11_ind - 035 change makes OCLC number unsearchable

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 16.02
-

Description:

In PROD/reindexing we added the subfield "z" in the section for the 035

```
035## PNO az  
035## 035 a
```

It was reported when searching oclc numbers, certain records are not pulling up correctly, I am thinking its because of the new setup:

```
system #6357703  
|a (OCoLC)00724018 |z (OCoLC)29392609
```

Resolution:

Looking at the PNO with the following SQL:

```
SQL-ABC07> select z11_rec_key from z11 where z11_doc_number = '006357703';
```

We see this:

```
PNO 0072401829392609
```

The \$\$a and \$\$z have been combined into a single z11_rec_key.

It is your intention that both the \$\$a and \$\$z be browsable. You will need to do the same kind of thing with the 035 as you have the 010, that is, in tab11_ind, change:

```
035## PNO az
```

to:

```
a035 PNO  
z035 PNO
```

and add these to tab_expand_extract:

```
035## a a035  
035## z z035
```

Be sure to stop/restart ue_01 before testing.
