Question

In Aleph 20 we have parameter invgeninv.prn in .\acq\tab\print.ini, in Aleph 21 we have invgninv.prn. Which one is correct?

Answer

Some names had to be changed because they were too long

Rep_ver 18030 in Aleph 21

Description: GUI - some of the file names inside print.ini are too long. The file name is defined in <module>/tab/print.ini file col.5 and it is restricted to 12 characters.

When file names are defined as longer than 12 characters, the name is truncated. If the name is truncated then Windows does not know the filetype.

Implementation Notes: The following changes should be done:

1) ./Acq/Tab/print.ini

From:

InvGenInv 00 Y P invgeninv.prn

To:

InvGenInv 00 Y P invgninv.prn

2) ./Circ/Tab/print.ini

From:

BorCancel 00 N P borcancel.prn

To:

BorCancel 00 N P borcncl.prn
