

## Oracle import doesn't produce a log file

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 17.01
- 

### Description:

I did an oracle dump on the production server (`exp_current_library`) for each library and imported them into test server using `imp_current_library`. There was no problem with the export according to the logs, but I don't know where the logs are for the import process.

### Resolution:

`imp_current_library` does not produce a log, it writes any process information to the display (stdout). Our advise is to redirect the log into an output file manually (`imp_current_library > <log file>`).
