## p\_manage\_01: ORA-1653: unable to extend table

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 14.2
- 

### Description:

The p\_manage\_01\_e and e2 step failed. The errors are the following from the logs:

```
p_manage_01_e.log:Commit point reached - logical SQL*Loader-605: Non-data dependent ORACLE error occurred -- load discontinued..
```

```
p_manage_01_e2.log:Commit point reached - logical SQL*Loader-605: Non-data dependent ORACLE error occurred -- load discontinued..
```

I checked the alert log and found.

```
ORA-1653: unable to extend table CUN01.Z98 by 64000 in tablespace TS0_PROD_TAB.
```

```
ORA-1653: unable to extend table CUN01.Z98 by 64000 in tablespace TS0_PROD_TAB.
```

Looks like the ts0\_prod\_tab has to be extended. Unfortunately, I don't have OEM running at home, so I search around for the alter tablespace command. How do we restart? (hope not from the beginning).

### Resolution:

In the case of the ORA-1653 error, the job doesn't cancel, it just halts. Once you add the file to the tablespace, the job will resume.

Note: This is v14. It may be that this is different in later versions of Oracle / Aleph.
