

## How does the keyword search work with more than one term?

- **Article Type:** General
  - **Product:** Voyager
- 

### Description:

How does the keyword search algorithm work with more than one term connected by a Boolean operator?

### Resolution:

The way the TermA AND TermB keyword search would work is as follows, in this order:

1. gets all results for TermA
  2. gets all results for TermB
  3. ANDs the results
  4. imposes the 10,000 record limit
