
Moving oracle database from one server to another

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Desired Outcome Goal:

Move the Oracle database 11g from server A to server B, in a TWO_TASK set-up in Aleph.

1. How do we move the database?
2. What changes need to be made on the application server to adjust for the database move?

Procedure:

1. See the document "How to Clone an Oracle Database Using the CopyDb Package" from the "Instruction for Database Cloning" (KB 16384-28161).
2. As described in section 5 ("Post-Installation Operations") of the doc:

```
$alephe_root/aleph_start  
$ORACLE_HOME/network/admin/tnsnames.ora and  
$ORACLE_HOME/network/admin/listener.ora
```

need to be updated on the application server.

Category: Installation
