
pc_display_eng files are being loaded from usm50, why?

Description:

Our staff noticed some fields missing from the Order Info tab in version 19. I looked at it, and I see that we're getting the default display as set up in usm50 rather than the customized order-info table I had set up.

I tried clearing utf_files and restarted the pc_server. Restarted my client, and looked up an order. A whole bunch of usm50/pc_display_eng files were created in utf_files, but none from mit50. And I don't see any errors saying order-info file was not found in abc50/pc_display_eng, such as will happen when we don't have a customized file in error_eng.

Why is it using usm50 rather than abc50?

I went into the circ. client, and the same thing happened, a bunch of pc_display files loaded for usm50.

Resolution:

This is the result of the following line in the ./abc50/tab/path_convert:

```
$abc50_dev/abc50/pc_display_eng $usm50_dev/usm50/pc_display_eng
```

Eliminating it corrects the problem.

This line was being placed there by the v18 -> 19 Upgrade Express. The UE ver. 1.05 has been changed to not do this.
