

Loan receipt printing / Receipt Printer configuration

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Description:

I'm attempting to configure a 3 1/8 " thermal receipt printer on our aleph 20 installation. Is there any good information on how to make this work? The specific things I'm looking at right now is the ability to print variable length receipts rather than full length pages and multiple pages. Also, I'd like to suppress the "Page 1 of 1" at the top as well as the name of the form. Any assistance would be appreciated.

Resolution:

[From site:] The piece I was missing was the preview mode. Once I set DefaultPrintConfig=0 in alephcom.ini the process worked correctly and used the settings in html-print.
