Question

Which MetaLib resource configuration access methods are searchable via Primo Remote Search?

Answer

MetaLib's resource configuration access methods fall into 3 main categories:

- * Search & Retrieve: These are searchable via Primo Remote Search function (includes the following configurations types in the IRD configuration code field: Z39, Z39/SUTRS, EXTERNAL, ALEPH_X, WEBCONFIG_XML)
- * Search & Link: MetaLib can search these resources and but ONLY retrieves the number of hits. Records are not retrieved. They should not be included in QuickSets for Primo Remote Search. (includes EXTERNAL_JUMP, WEBCONFIG_SIMPLE, WEBCONFIG_COMPLETE)
- * Link-Only: MetaLib cannot search these resources. Their IRD configuration code field is empty for Link-Only resources. They should not be included in QuickSets for Primo Remote Search

Additional Information

Descriptions of MetaLib access methods can be found in the Documentation Center > MetaLib > Technical Documentation > Version 4.x > Resource Management > Metalib Resource Management Guide.pdf.
