

p_item_06 command

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Description:

Since running p-item-06 will cause all the jobs in the XXX50 library to be backed up behind it I want to run it in the background. What would the command be to run it in the background?

Would it be this?

```
csh -f $aleph_proc/p_item_06 ABC50 > & $alephe_scratch/abc50_p_item_06_yyyymmdd.log &
```

Resolution:

Yes. That command looks good. But I think it would be better to avoid running jobs which update item records (to prevent possible collisions).
