
Count of z00p's for publishing_set doesn't match OPAC hits

- **Article Type:** General

Description:

I've started to experiment with the publishing mechanism. I chose a small logical base to use, SFXCO, which contains slightly over 10,000 bib records as tallied by a wsl=sfxco search.

When publish_04 finished, the z00p table showed more than 23,000 entries when I did a "select count (*) from z00p where Z00P_SET = 'SFXCO'". Why the discrepancy in the numbers?

Resolution:

You are specifying a base of SFXCO in tab_publish. As can be seen in tab_base.eng, the Find command for SFXCO is:

```
wsb=(sfxco or www) not wst=(suppressed or deleted or circ-created or oclc-del)
```

If you enter in this *complete* command, you get 24,405 results. (sfxco gets 10,486 and www, 14,069.)
