

Many-to-many configuration

- **Article Type:** General
 - **Product:** Primo
 - **Product Version:** 2
-

Description:

In many_to_many scenario only, the parent directories of Primary and slave indexes should NOT be the same one - for example, the correct index topology would be /exlibris/primo/indexes/master_index/inst_1_index for the master FE's index, and /exlibris/primo/indexes/slave_index/inst_1_index for the slave FE.

The reason for that demand is that index crash-related files reside in those dirs, and we want both FEs in many_to_many to manage their crash flow separately, that is to have separated files for that matter

Resolution:

The documentation has been updated with this information.
