
Prebulk: encoding level blank in mfhd

- **Product:** Voyager
 - **Product Version:** Voyager 5
 - **Relevant for Installation Type:** Total Care; Dedicated-Direct; Direct; Local
-

Symptoms

mfhd created by Prebulk has Encoding Level of blank which is not valid MARC value

Defect Status

Issue 16384-11361 / VYG-4480 is currently in Development.

Replication Steps

On the server

1. Create a prebulk configuration file that is set to create mfhd records
2. Get a bib file with mapping so that the mfhd will be created
3. **Run prebulk using the config file:** `Pprebulk -c<name and location of prebulk config file>
-i<name and location of bib input file>`
4. Go to the /rpt directory and look at the out.prebulk or ftp it down to your PC and look at it in a MARC viewer. Note Encoding Level is blank. Or, use Bulk Import to import out.prebulk using -m parameter, then look at mfhd in the Cataloging client.

Workaround

Edit mfhd encoding level in interleaved file, or update via Global Data Change (GDC) after import.
