
ASLM / Cobol problems

- **Article Type:** General
- **Product:** Aleph
- **Product Version:** 21, 22, 23

Problem Symptoms:

We are testing switching to new hardware.

Here was the initial ALSM error:

```
> dlib abc01
```

```
ASLM: Semaphore failure. Rerun as root
```

```
ASLM: Errno 1013
```

Then our Solaris folks ran: `$COBDIR/aslmf/aptrack`

then got this:

```
root@libprd /exlibris/aleph/a18_1/product/local/cobol/aslmf: aptrack
```

```
The Application Server license database cannot be created.
```

```
You must run the utility 'initaslm' as root, before trying again.
```

They are hesitant to take the next step. Can you advise.

Once this is solved we'll need all the steps so we (or you) can help when we do the hardware switch for real.

Cause:

COBOL license was copied.

Resolution:

Re-install the License Manager, the development license and the runtime license of the COBOL environment Micro Focus Server Express.

See Article "[How to reinstall the licenses of the COBOL environment for Aleph](#)" -- link below -- for detailed instructions.
