## Solaris 11 env.:SP installation failed with wget error

- **Article Type:** Known Issue
  - **Product:** Rosetta
  - **Product Version:** 4.1
- 

### Symptoms

Using the util to install a Rosetta SP, installation is aborted with the following error in the log:

```
INFO: Using /usr/sfw/bin/wget for WGET
```

```
INFO: Retrieving linklist
```

```
INFO: jdk1.7.0_75.SunOS.i386 added to download list
```

```
INFO: openssl-0.9.8zf.SunOS.i386 added to download list
```

```
INFO: Download process started in /exlibris/ftp_from_exlibris
```

```
INFO: Check the log file /exlibris/dps/d4_1/log/wget_product.log for progress
```

```
Installing 3rd party products. This may take a while
```

```
rm: /exlibris/dps/d4_1/log/create_prod_links.log: No such file or directory
```

This happens because the current wget version Rosetta is using doesn't work with Solaris 11.

---

### Workaround

Until a permanent solution is implemented, you can manually copy the wget on each server from the util directory to the product directory:

```
dps_util
```

```
cp -p /bin/wget /exlibris/product/wget-1.12/bin/
```

Then normal installation can be continued.

**Category:** Installation, Service Pack

**Subject:** Installation, Upgrade, Removal
