
Keyword searches retrieve completely unrelated words

- **Product:** Aleph
 - **Product Version:** 22
 - **Relevant for Installation Type:** All
-

Description:

Keyword searches retrieve completely unrelated words. For example, a search on the word “train” displays a “no hits” screen, with words which are supposedly just before and after “train”, but, in this case, are random beginning with “/e” -- despite the fact that there are records containing the word “train”.

Resolution:

Util a/17/14 (“Drop & Create Table and Index”) for the z97 showed that the z97_id (built on the z97_word column) was missing. An attempt to build it with util a/17/2 (“Create Index”) failed with a duplicate keys error, but util a/17/18 (“Search for Duplicate Keys”) was successful. See link to article

“Cannot CREATE UNIQUE INDEX; duplicate keys found; using util a/17/18” below.

[Note: Though it could occur with any bib library, in this case it occurred with v22 usm01 data.]

And also: "Searches/results for another user appear on screen"
