Description

In multi-ADM environment, sometimes a loan is permitted although a block is defined in tab_check_circ. When a block is defined in tab_check_circ with 'CHARGES' parameter in one ADM and with no parameter in the second ADM, sometimes the parameter value is used for both ADMs.

For example, in a multi ADM environment (USM50 and USM51) if the following line appears in USM50 in tab_check_circ

```
LOAN      check_circ_10_a
```

and the following line in USM51:

```
LOAN      check_circ_10_a          CHARGES=-0011
```

Sometimes loans are not blocked in USM50 for a patron having an open debit transaction of type 0011.

Resolution

Corrected by v22 rep_change 2464 and v23 rep_change 3070 -- a change to the check_norm_par_chargesl program.
