

u-tree files containing hostname

- **Product:** Aleph
 - **Product Version:** 20, 21, 22, 23
 - **Relevant for Installation Type:** Dedicated-Direct, Direct, Local, Total Care
-

Question

In copying Aleph u-tree files from one server to another, what files contain the hostname (and need to have it changed)?

{This can occur, for instance, in copying u-tree files from a Test server where the upgrade has already been performed (and the files have been upgraded) to the Prod server -- rather than running Upgrade Express on the u-tree and redoing the updates.}

Answer

Files which contain the hostname are:

```
$alephe_root/aleph_start  
$alephe_root/www_server.conf  
$alephe_root/apache/httpd.conf  
$alephe_root/apache/ssl.conf  
$alephe_root/apache/htdocs/main.html  
$alephe_root/apache/htdocs/.index.html  
  
$alephe_root/alephe/www_c_eng/management.css  
$alephe_root/alephe/www_f_eng/exlibris.css
```

After making these changes, aleph_shutdown/aleph_startup needs to be run and apache needs to be restarted for them to be in effect.
