
cir-30 / cir-31 output doesn't fit on screen properly

- **Product:** Aleph
 - **Product Version:** 20, 21, 22, 23
 - **Relevant for Installation Type:** Dedicated-Direct, Direct, Local, Total Care
-

Description

The output from the cir-30 and/or cir-31 Services either:

1. doesn't fit on the screen (it is truncated on the right hand side or when you look at them in the Aleph client and try to print them, if wordwrap is turned on, it adds blank lines to the printout and doesn't look good);
2. doesn't take full advantage of a wider screen (it wraps sooner than it needs to).

Resolution

The width of lines output by SQL is determined by the SQL "set linesize" command. The default linesize is set in the \$ORACLE_HOME/sqlplus/admin/glogin.sql . You can change it to the value most appropriate for the screens at your site.

The linesize can also be set for the output of a particular SQL script in the script itself. The SQL for the cir-30 and cir-31 Circ Statistics Services can be found as "cir_stat_nn_xxxx_xxx_param.sql" files in the /exlibris/aleph/a23_1/alephm/sql_stat directory. These files do not have any linesize specified (and, thus, are using the glogin.sql default). A linesize can be added (at the beginning of the file, with the other "set" lines) like this:

```
set linesize nnn
```

One site found that a linesize of 72 was wide enough to handle the output for the cir-30/cir-31 reports.
