
NCIP using USM50 library rather than local ADM library

- **Product:** Aleph
 - **Product Version:** 20, 21, 22, 23
 - **Relevant for Installation Type:** Dedicated-Direct, Direct, Local, Total Care
-

Description

The BorrowDirect NCIPMessage transactions in the `www_server` log have lines like this:

```
Load: /exlibris/aleph/a21_1/usm50/tab/tab100
Load: /exlibris/aleph/a21_1/usm50/tab/tab_ncip.conf
```

indicating that the program is looking at the `usm50` tables rather than the local `xxx50` ADM tables

Resolution

This indicates that there is no

```
setenv www_ncip_library_...
```

line for the relevant `ncip` ip address in `$alephe_root/www_server.conf`.

(See details below.)

One site with this problem wrote: "We've resolved this issue. I took out all the old IP addresses in `www_server.conf` and in `tab_attr_sub_library` and that seems to have worked."

Additional Information

The `./www_com/www_ncip` program has this code:

```
01  DEFAULT-LIBRARY          PICTURE X(5) VALUE "USM50".
...
...

STRING
    "www_ncip_library_"
    CLIENT-IP-ADDRESS
DELIMITED BY SIZE INTO
    ENV-NAME
END-STRING.
```

```
MOVE 100 TO L.
CALL "len_count" USING
    ENV-NAME
    L
END-CALL.

MOVE SPACES TO CURRENT-LIBRARY.
MOVE L TO N2-N.
CALL "get_env" USING
    ENV-NAME
    N2-X
    CURRENT-LIBRARY
END-CALL.

IF CURRENT-LIBRARY = SPACES
THEN
...
...

IF ERROR-CODE = ZERO
THEN
    MOVE CURRENT-LIBRARY TO ACTIVE-LIBRARY
ELSE
    MOVE DEFAULT-LIBRARY TO ACTIVE-LIBRARY
END-IF.
```
