
Internal Server Error when testing SUSHI settings

- **Product:** 360 Counter
-

Question

When I click on Test SUSHI Settings for a few providers in the COUNTER DRS Request Form the following error message appears. What does it mean and will my data be harvested successfully?

```
jqXHR: {"readyState":4,"responseText":{"\"Message\": \"There was an error processing the request.\", \"StackTrace\": \"\", \"ExceptionType\": \"\", \"status\": 500, \"statusText\": \"Internal Server Error\"}; textStatus: error; errorThrown: Internal Server Error
```

Answer

Please disregard the error message. Our developers are investigating and working to address it. Your SUSHI harvesting should function properly as expected, regardless of the error.
