

Prediction template with empty enumeration level

- **Product:** Alma
-

Description

We use prediction templates. Our serials have only the second level of enumeration. The first level of enumeration is empty. However, when we leave the field "First level of enumeration" blank, all issues are "no. 1".

Resolution

Use a caret character (^) in the field "first level of enumeration". By doing so the first level will be skipped and only information from the second level will be used.
