
Defective "ELAPSED-TIME" lines in pc_server log

- **Product:** Aleph
 - **Product Version:** 20, 21, 22, 23
 - **Relevant for Installation Type:** Dedicated-Direct, Direct, Local, Total Care
-

Description

The pc_server log sometimes has lines like this:

```
ELAPSED-TIME: C0511 2017-04-25 11:14:15 22 [002] [log] version 22.01 format ALEPH  
compression 3 encryption 0
```

This is different than the other "ELAPSED-TIME" lines in the log and seems messed up.

Resolution

This is a defect in the pc_server logging process. A standard transaction "ELAPSED-TIME" line looks like this:

```
ELAPSED-TIME: C0121      15:25:38           0.0087
```

A standard "version" line looks like this:

```
2017-04-26 12:32:25 56 [000] [log] version 23.01 format ALEPH compression 3  
encryption 0
```

It seems like the version line for one transaction has overwritten the last part of the previous transaction's ELAPSED-TIME line. It seems that this can happen when the pc_server is very busy.

Though this is unsightly and confusing, we have found that it is **not** associated with any real problem with data, updates, etc.
