

Working with App Code

When configuring a service, a profile, or the app in the App Builder, you can select **Code** to work directly with the general or tile configuration properties of the service, profile, or app's code.

App Code Button

App Code

It is recommended not to touch the code. However, working with the code is sometimes the most convenient way of performing certain tasks, such as reordering elements in the app UI; be sure to preserve the open and close brackets when moving elements. When you are done, select **props** to return to using the UI.

Note

Do not touch the code of any services with dynamic tiles (see [Changing App Manager Installation Settings](#)), since this will break the tile. These services have a URL for their Image property, for example:

```
"Image": "https://portal.ombiel.co.uk/assets/Headers/..."
```

The menuRef code that appears inside a service's code indicates the type of service:

- **TILE** - A basic, feed, or banner service. For a feed service, the **Feeds** field is also defined. For a banner service, the **Banners** field is also defined.
- **PG** - A static content service.
- **AEK#####** - An integrated service, where ##### is an internal component number.
