

Analytics Configuration - Other Settings

The following parameters can be configured on this page [Configuration > Analytics > Other Settings](#):

- **analytics_display_local_params** – When set to `true`, Alma Analytics displays the field that was set as a local parameter in analytics reports. This is possible for the local parameters under [Physical Items > Bibliographic details and Physical Items > Holdings Details](#). The field appears as a prefix to the current local parameter field name. Users must wait up to 24 hours after activating the customer parameter for the functionality to work in analytics.
- **enable_usage_tracking** – When set to `true`, Alma collects usage of Alma Analytics in the institution. This is then reflected in the Analytics Usage Tracking subject area. This subject area becomes available a week after the parameter is set and the data included is from one week prior to the parameter's activation. For example, if the parameter was set to true on November 13th, the Usage Tracking subject area will be available by November 20th and will include data as of November 6th. For more information, see [Analytics Usage Tracking](#).
- **support_partial_analytics_designer** – When set to `true`, the limited Alma Analytics design roles are available that give the user access to specific subject areas only. For more information, see [User Roles – Descriptions and Accessible Components](#).
