

## DC metadata fields Language settings

- **Product:** Rosetta

As of Rosetta 5.5, the language settings of DC metadata fields were changed to use a shorter encoding according to W3C recommendation.

Customers whose original installation was prior to Rosetta version 5.5, will need to adjust the changes in their local configuration file.

### Question

How to change Dublin-Core configuration file according to the updated encoding?

### Answer

1. Go to Administration > General > Configuration Files
2. Filter by File Group: Metadata Editing Configuration, Sub-Group: Web Editor
3. Edit file: webeditor\_dublincore\_configuration.xml
4. Replace the values for xml:lang qualifiers

From:

```
<qualifier>
  <code>xml:lang</code>
  <desc>Language</desc>
  <format>LIST</format>
  <values>
    <value>English</value>
    <value>Hebrew</value>
    <value>French</value>
  </values>
</qualifier>
```

To:

```
<qualifier>
  <code>xml:lang</code>
  <desc>Language</desc>
  <format>LIST</format>
  <values>
    <value>en</value>
    <value>he</value>
    <value>fr</value>
  </values>
</qualifier>
```
