

manage-70: "Library mismatch error"

- **Product:** Aleph
 - **Product Version:** 20, 21, 22, 23
 - **Relevant for Installation Type:** Dedicated-Direct, Direct, Local, Total Care
-

Description

We get the message "Library mismatch error" in running manage-70 even though the \$aleph_scratch input file *does* have the correct library (in the form "000123456XXXnn" <where XXXnn is the library>).

Resolution

Though the \$alephe_scratch input file has "000123456XXXnn", there's a \$data_scratch input file which has an incorrect form, for instance, "000123456 ".

The program is set up to check for the input file first in the \$data_scratch, and, only if not found there, to look in \$alephe_scratch.

You need to either delete the \$data_scratch file or correct it.
