

7.3 Set Management

Duration	6 min.
Description	Sets in Rosetta allow you to run a process on many objects at a time (IEs, REPs, or FILEs). Itemized sets are based on manually adding and removing members. Logical sets are based on the results of a search query, and they grow dynamically whenever those results change. You can create new sets, and update the contents of existing sets.
Target Audience	<ul style="list-style-type: none">• Rosetta Staff Users
Prerequisites	<ul style="list-style-type: none">• Rosetta Data Model
