## fix doc aut duplicate depends on field order

- **Description**

fix\_doc\_aut\_duplicate creates an empty subfield \$7 instead of subfield \$7 including the record's 1XX contents, if the record's 1XX field is located after the 4XX-field being handled - e.g. when the record which should be fixed is result of a merge, where 1XX field is copied from incoming record.

For example: Running fix\_doc\_aut\_duplicate for the following "record":

```
000000046 4102 L $$aAhto  
000000046 1102 L $$aAhtausteknillinen opisto
```

results in empty subfield \$7:

```
000000046 4102 L $$aAhto$7  
000000046 1102 L $$aAhtausteknillinen opisto
```

instead of correct version:

```
000000046 4102 L $$aAhto$7Ahtausteknillinen opisto  
000000046 1102 L $$aAhtausteknillinen opisto
```

### Resolution

This empty subfield \$7s were fortunately easily avoided by preceding fix\_doc\_aut\_duplicate with fix\_doc\_sort in tab\_fix

**Product:** Aleph
